*Input:* A digraph  $G$ , weights  $c : E(G) \rightarrow \mathbb{R}$ .

*Output:* A circuit  $C$  with minimum mean weight or the information that  $G$  is acyclic.

① Add a vertex  $s$  and edges  $(s, x)$  with  $c((s, x)) := 0$  for all  $x \in V(G)$  to  $G$ .

② Set  $n := |V(G)|$ ,  $F_0(s) := 0$ , and  $F_0(x) := \infty$  for all  $x \in V(G) \setminus \{s\}$ .

③ For  $k := 1$  to  $n$  do:

For all  $x \in V(G)$  do:

Set  $F_k(x) := \infty$ .

For all  $(w, x) \in \delta^-(x)$  do:

Delauney.cpp

Description: Fast Delaunay triangulation. Each circumcircle contains none of the input points. There must be no duplicate points. If all points are on a line, no triangles will be returned. Should work for doubles as well, though there may be precision issues in 'circ'. Returns triangles in order {t[0][0], t[0][1], t[0][2], t[1][0], ...}, all counter-clockwise.

Time:  $\mathcal{O}(n \log n)$
